SURGICAL ESTHETICS® SUTURES PGCL

PGCL (Polyglycolide–co–Caprolactone) sutures are synthetic, absorbable monofilament sutures designed for soft tissue approximation in oral and periodontal surgery. They provide predictable resorption with excellent tensile strength during the critical healing phase.

SURGICAL ESTHETICS® SUTURES PGLA

PGLA (Polyglactin 910) sutures are braided, synthetic absorbable sutures coated for smooth passage. They are designed for predictable absorption while maintaining initial tensile strength for soft tissue support in oral surgery.

SURGICAL ESTHETICS® SUTURES POLYPROPYLENE

Polypropylene sutures are non–absorbable, synthetic monofilament sutures ideal for applications requiring long–term tissue support and minimal tissue reactivity. Plaque will not grow on polypropelene.

PREMIUM SUTURES

SURGICAL ESTHETICS® SUTURES SILK

Silk sutures are non-absorbable, braided natural sutures valued for their excellent handling and knot security. They are commonly used in oral and periodontal surgery where reliable soft tissue closure is required.

SURGICAL ESTHETICS® SUTURES GUT

Gut sutures are natural absorbable sutures derived from purified collagen. They are used in oral surgery for short-term tissue approximation where resorbable closure is preferred.

SURGICAL ESTHETICS® SUTURES PTFE

PTFE (Polytetrafluoroethylene) sutures are non-absorbable monofilament sutures designed for use in periodontal and implant surgery. Their smooth surface and inert composition minimize tissue inflammation and bacterial adhesion.
